

Why does the Easy Internet browser dial the ISP connection number the area code even though it is local. PCV E204

This occurs when the Easy Internet browser is being used in conjunction with a previously setup ISP dialup connection. The Easy Internet browser will change the the ISP phone number setting to include the area code, because it does not recognize that the number being dialed is already in the same area code. To fix this issue, simply remove the area code from the dial-up connection settings.

1. Double-click the Easy Internet browser icon on the desktop to launch it.
2. On the left-side menu, click Options.
3. Under Dialing Setup, click Change Number.
4. Remove the area code from the phone number box presented and click OK.
5. Click the GTE button to launch the ISP connection.
